

## B Appendix B

**Note** All supplementary data described by appendices B, C, D, E and F are found on the accompanying CD.

### Tables of target stars and sample table of the calculations to scale the bias frames obtained at the New Technology Telescope (NTT) at La Silla, Chile

The following PDF files give the details of the target stars used for the observing runs at the New Technology Telescope (NTT) at La Silla, Chile and the Anglo Australian Telescope (AAT) in Australia as well a sample of the calculations needed to scale the bias frames obtained at the NTT in order to be able to reduce the data. These are all discussed in Chapter 2.

#### B.1 Local Bubble

This table lists the target stars for the Local Bubble project, see Section 2.1.1.2. Each row in the table gives the information relating to one star. From left to right the information in the columns of the table are 1) name of target star, 2) the right ascension coordinate of the star in hours, minutes and arcseconds, 3) the declination coordinate of the star in hours, minutes and arcseconds, 4) the two values describing the stars propper motion, 5) the distance in parsecs to the target star, 6) the V magnitude of the target star and 7) the spectral type of the target star.

## B.2 SMC TARGETS

This table lists the target stars for the SMC in the Magellanic Cloud project, see Section 2.1.2.2. Each row in the table gives the information relating to one star. From left to right the information in the columns of the table are 1) name of target star (which for these stars are just numbers), 2) the right ascension coordinate of the star in hours, minutes and arcseconds, 3) the declination coordinate of the star in hours, minutes and arcseconds, 4) the V magnitude of the target star and 5) the spectral type of the target star.

### B.3 LMC TARGETS

This table lists the target stars for the LMC in the Magellanic Cloud project, see Section 2.1.2.2. Each row in the table gives the information relating to one star. From left to right the information in the columns of the table are 1) name of target star (which for these stars are just numbers), 2) the right ascension coordinate of the star in hours, minutes and arcseconds, 3) the declination coordinate of the star in hours, minutes and arcseconds, 4) the V magnitude of the target star and 5) the spectral type of the target star.

## B.4 Scaling Bias frames

This table is an example of the calculations for the 20th August 2012 needed to scale the bias frames from the NTT data to a common intensity level. This procedure is described in Section 2.1.1.3.

Each line of the table relates to one bias frame. The figures are ADU values. The bias frames were split in two by a difference in intensity values, the left hand side of the bias frame having a higher average intensity than the right hand side. As described in Section 2.1.1.3 the bias frames had various intensity values throughout the night and it was not possible to combine them into a useful master bias frame. Statistical analysis of the frames gave a median value for the intensity of both halves. The average value of the intensity of each frame was calculated (see the last line of the table) and the difference in intensity between each bias frame and this average value was calculated. From left to right each column of this table is 1) the median value of intensity for the left hand side of each bias frame, 2) the addition factor needed to adjust the value in column 1 to the mean value of all bias frames, 3) the mean value of the intensity of the left hand side of all bias frames, 4) the median value of intensity for the right hand side of each bias frame, 5) the addition factor needed to adjust the value in column 4 to the mean value of all bias frames and 6) the mean value of the intensity of the right hand side of all bias frames.

## B Tables of target stars
