

TALKS

Table of Contents

PLENARY LECTURES

Saturday 6 July

- 3 Opening Plenary Lecture

Sunday 7 July

- 3 IUBMB Lecture
- 3 The FEBS Journal Richard Perham Prize Lecture
- 3 FEBS/EMBO Women in Science Award Lecture

Monday 8 July

- 4 FEBS Datta Lecture
- 4 FEBS Sir Hans Krebs Lecture

Tuesday 9 July

- 4 FEBS Theodor Bücher Lecture
- 5 FEBS 2019 Plenary Lecture

Wednesday 10 July

- 5 PABMB Lecture
- 5 EMBO Lecture

Thursday 11 July

- 5 Closing Plenary Lecture

FEBS SPECIAL SESSIONS

Sunday 7 July

- 6 Gender issues in science

Monday 8 July

- 6 Education 1 – Creative teaching: effective learning in life sciences education

Tuesday 9 July

- 7 Education 2 – Future education now!
- 7 Science and Society – Personalised medicine: a future vision

Wednesday 10 July

- 8 Research and career skills

SYMPOSIA

Sunday 7 July

- 9 Molecular mechanism of inflammation-related diseases
- 10 DNA variation
- 12 Cardiovascular diseases

- 13 Intracellular ion channels and transporters

- 15 RNA processing

- 16 Signal transduction

- 17 Mitochondria and signaling

- 18 DNA architecture

- 19 RNA transcription

Monday 8 July

- 20 DNA editing and modification

- 22 RNA transport and translation

- 24 Single cell analysis and imaging

- 25 Calcium and ROS signaling

- 26 Sulfur metabolism and cellular regulation

- 27 Molecular neurobiology

- 29 RNA turnover

- 30 Cytoskeleton and molecular mechanisms of motility

- 31 Rare diseases

Tuesday 9 July

- 32 Signaling in brain cancer

- 34 Synthetic biopolymers for biomedicine

- 35 Integrative approaches to structural and synthetic biology

- 37 Induced pluripotent cells

- 39 Long noncoding RNA

- 40 Neurodegeneration

- 42 Cell therapy and regenerative medicine

- 44 Small noncoding RNA

Wednesday 10 July

- 45 Proteins: structure, disorder and dynamics

- 47 Plant biotechnology

- 48 Natural networks and systems

- 50 RNA in pathogenesis and therapy

- 51 Biochemistry, a success story

- 52 Molecular biology of aging

- 53 Plant–environment interaction

- 54 Synthetic networks and systems

- 55 Multicomponent complexes

Thursday 11 July

- 57 Cell signaling in tumor biology

- 59 Bionanotechnology

- 60 Epigenetics and protein glycosylation

- 61 Genome editing (CRISPR)

- 62 Proteomic technologies

Abstracts submitted to the 44th FEBS Congress, taking place in Krakow, Poland from 6th to 11th July 2019, and accepted by the Congress Organizing Committee are published in this Supplement of *FEBS Open Bio*. Late-breaking abstracts are not included in this issue.

About these abstracts

Abstracts submitted to the Congress are **not peer-reviewed**. In addition, abstracts are published as submitted and are **not copyedited** prior to publication. We are unable to make **corrections of any kind** to the abstracts once they are published.

Indexing

Abstracts published in *FEBS Open Bio* Supplement for the 44th FEBS Congress will be included individually in the Conference Proceedings Citation Index published by Web of Science.

How to cite these abstracts

AuthorOne, A., AuthorTwo, B. (2019). Abstract title. *FEBS Open Bio*, 9: Abstract number*. doi:10.1002/2211-5463.12674

* The Abstract number begins with the letters PL, SS, S or ShT and can be found atop each abstract's title in the PDF file.

differential processing of proenkephalineric and proopiome-lanocortin (POMC) systems among controls, prolactin-secreting microadenomas, and non-secreting macroadenomas. We will present our discovery data on growth hormone (GH) isoforms, differentially expressed proteins ($n = 56$) between controls and macroadenomas, novel phosphoproteins, and oxidative stress nitroproteins (NS). All of these data profoundly impact on our knowledge of human neuroendocrinology.

Omics in precision medicine

J. Bergquist

Analytical Chemistry and Neurochemistry, Department of Chemistry – Biomedical Centre, Uppsala University, Uppsala, Sweden

It has been estimated that only Alzheimer's disease (AD) alone, the most common form of dementia, will affect approximately 81 million individuals by 2040. To date, the actual cause and cascade of events in the progression of many neurological and neurodegenerative diseases have not been fully determined. Furthermore, there is no definitive blood test or simple diagnostic method for many of those diseases so far available. Fibril formation of proteins, together with a dysfunctional regulation of lipids and steroids, has been shown to play a fundamental role influencing various risk factors of neurodegeneration and pathogenesis. Recently, there has been a stronger focus on proteomics and metabolomics (e.g. lipidomic) studies with the hope of increasing our understanding of the underlying mechanisms leading to disease. Technological advancements in high-resolution mass spectrometry and rapid improvements in chromatographic techniques have led to quick expansion of the field of in this research. In this presentation, emphasis is given to the new developments in technologies and their applications in disease biomarker discovery.

S-39-2

Large-scale label-free clinical proteomics and phosphoproteomics for precision medicine

C. Jimenez

OncoProteomics Laboratory, Department of Medical Oncology, VUmc-Cancer Center Amsterdam, Amsterdam, the Netherlands, Amsterdam, Netherlands

The general goal of our clinical cancer proteomics efforts is to disclose tumor biology and drive improved diagnostics, treatment and management of cancer. To this end, we use label-free mass spectrometry-based proteomics that is optimally suited for large-scale clinical sample profiling. I will highlight our work in various cancer types with a focus on exosome proteomics for non-invasive diagnostics and phosphoproteomics for response prediction. More specifically, I will discuss our prostate cancer effort that made use of an innovative workflow for high-throughput extracellular vesicle proteomics applied to prostate cancer cell lines and urinary patient samples. Furthermore I will highlight our newly developed computational analysis approach for Integrative inferred kinase activity (INKA) analysis that can rank kinase activities in mass spectrometry-based phosphoproteome data derived from single samples. We show that INKA can uncover oncogenes, differential kinase activity and drug targets. We believe that cancer proteomics powered by precise measurements and dedicated analysis will realize the full potential of multi-parameter diagnostics and personalized medicine.

Semi-targeted metabolomic studies of methamphetamine's biotransformations and its impact on macrophage's secreted metabolome

K. Pawlak¹, K. Lech², A. Veř³, A. Harwood³, P. Ciborowski³

¹*Faculty of Chemistry, Warsaw University of Technology, Warsaw, Poland,* ²*Faculty of Chemistry, Warsaw University of Technology, Warszawa, Poland,* ³*Department of Pharmacology and Experimental Neuroscience, University of Nebraska Medical Center (UNMC), Omaha, United States of America*

Methamphetamine (MA) is an illegal psychostimulant. Despite the prevalence of MA addiction, its effect on the innate immune system is not known. Several reports showed the effect of MA on various aspects of intracellular signaling, yet changes in intracellular and secreted metabolomes induced by MA in human monocyte derived macrophages (hMDM) has been understudied. In this study, we used a semi-targeted metabolomic approach to investigate the effect of MA on macrophages secreted metabolism. Culture supernatants from hMDM exposed to MA or controls were subjected to solid phase extraction (SPE, Plexa PCX) or liquid-liquid extraction and followed by reversed phase chromatography performed with two columns connected in-line (EC 50/2 Nucleodur C18 Pyramid, 3 μ m and EC 150/2.1 Cogent, UDC-Cholesterol, 4 μ m). A QTRAP 6500 MS/MS System with a Turbo Spray ion source (SCIEX, Framingham, MA, USA) working in multiple reaction monitoring mode (MRM) was used as a detection system. Selected MRM list was based on research papers, databases (e.g. HMDB, METLIN). During analytical work-flow, identity verification was found as the most critical step. It was performed using enhanced product ion mode (EPI) supported by a chemical characteristic of analytes (RPLC – polarity and SPE – acid-base properties). Results presented in this paper describe three novel aspects of metabolomic research. First, we present an attempt to analyze the metabolic secretome of hMDM exposed to Meth in comparison to non-exposed control cells. We measured 94 metabolites and identified 11 that were significantly different between control and Meth-exposed macrophages. Our new analytical approach, utilizing combined C18 and Cogent columns, allowed us to separate and identify OHMA isomers. Lastly, we have found two presumably unknown metabolites pending structural determination and confirmation. This work is supported by R01 DA043258 and P30 MH062261 grants from National Institutes of Health (USA).

ShT-39-2

Development of a diagnostic SARI test system based on protein microchip for detection and forecasting the severity of acute respiratory infections

A. Taraskin^{1,2}, A. Lozhkov¹, M. Plotnikova¹, S. Klotchenko¹

¹*Smorodintsev Research Institute of Influenza, Saint-Petersburg, Russia,* ²*Peter the Great St. Petersburg Polytechnic University, Saint-Petersburg, Russia*

According to the World Health Organization (WHO), acute respiratory viral infections cause the overwhelming majority of all reported infectious diseases, yet methods for their molecular diagnosis are limited. The purpose of this study is to develop a multi-parameter diagnostic assay, including a set of reagents, based on protein microchip technology, which allows personalized diagnosis of influenza-like illnesses and severe acute respiratory infections (SARI). Ideally, such diagnostics will be capable of determining etiological agents and providing prognostic
